

**Supplementary figure 1 : Coral Expression Atlas serving exploration of Differential Expressed Genes (DEGs) in all pairwise comparisons.** A- According to known and annotated genes (a) all accessible categories ranked by their number of DEGs. (b) Main exploratory scatter plot with all four pairwise comparisons where each dot is a gene displayed according to its Log2FC and clickable. The highlighted color is green, if in grey it means FDR is not significant. (c) Supplementary heatmap colored according to Log2FC. Order is at choice by clicking on the desired condition and the conditions are selectable. (d) Highlighted gene information, Log2FC and FDR for each pairwise comparison, normalized counts and functional annotation. B - According to unknown DEGs. (a) Main scatter plot, several genes are selectable and highlighted in (b). Finally the summary of selected genes is downloadable as table and png.
